

CSC148: A Closer Look at the Grouping Algorithms for Assignment 1

Suppose we have the following set of students in a course. For simplicity, we're only listing their IDs and names:

ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
-----------------------	-----------------------	----------------------	----------------------	----------------------

ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
--------------------------	---------------------	---------------------	----------------------

Each of the Grouper classes will group these students in different ways, described in their docstrings and below.

AlphaGrouper

The AlphaGrouper class will group students alphabetically. Suppose we're forming groups of size 2. The groups formed should then be:

ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 6 Name: Christine	ID: 4 Name: Diane	
ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 5 Name: Misha	ID: 9 Name: Nidhi	ID: 1 Name: Sophia

Where the students are arranged alphabetically, and then split into groups accordingly.

RandomGrouper

The RandomGrouper class uses no particular ordering to determine groups: students are simply randomly placed into a group. At most, one group can have fewer than the required number of members.

For example, when group sizes are 2, one possible grouping could be:

ID: 5 Name: Misha	ID: 7 Name: Alex	ID: 2 Name: Jaisie	ID: 9 Name: Nidhi	
ID: 4 Name: Diane	ID: 8 Name: Amin	ID: 6 Name: Christine	ID: 3 Name: Mario	ID: 1 Name: Sophia

However, there are many different possibilities, and the groupings can change every time a RandomGrouper makes groups.

GreedyGrouper

The GreedyGrouper class forms groups in a "greedy" manner: we first get a list of students ordered by ID.

ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi	

The first student who is not part of a group is placed into the first group. In this case, Sophia is in the first group.

ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi	

Afterwards, the student that would increase this group's score the most (or reduce it the least) will be added to that group, breaking ties by ID.

Suppose we get the following changes to the first group's score for each student:

ID: 1 Name: Sophia	ID: 2 Name: Jaisie Score +0	ID: 3 Name: Mario Score +2	ID: 4 Name: Diane Score -1	ID: 5 Name: Misha Score +5
-----------------------	-----------------------------------	----------------------------------	----------------------------------	----------------------------------

ID: 6 Name: Christine Score +4	ID: 7 Name: Alex Score -2	ID: 8 Name: Amin Score +3	ID: 9 Name: Nidhi Score +5
--------------------------------------	---------------------------------	---------------------------------	----------------------------------

Then Misha would be added to the first group:

ID: 1 Name: Sophia	ID: 5 Name: Misha	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane
-----------------------	----------------------	-----------------------	----------------------	----------------------

ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
--------------------------	---------------------	---------------------	----------------------

We would repeat the previous step until the group reaches our intended size, finding the change in scores for the remaining students and adding the student that would increase the score the most (or decrease it the least) into the group.

Suppose we're using groups of size 2. Then this first group is finished, and we repeat our steps with the next student who has yet to be put into a group, Jaisie:

ID: 1 Name: Sophia	ID: 5 Name: Misha	ID: 2 Name: Jaisie
-----------------------	----------------------	-----------------------

ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
----------------------	----------------------	--------------------------	---------------------	---------------------	----------------------

And suppose each student would result in the following changes to the score of Jaisie's group when added:

ID: 1 Name: Sophia	ID: 5 Name: Misha	ID: 2 Name: Jaisie
-----------------------	----------------------	-----------------------

ID: 3 Name: Mario Score -15	ID: 4 Name: Diane Score -3	ID: 6 Name: Christine Score -6	ID: 7 Name: Alex Score -3	ID: 8 Name: Amin Score -4	ID: 9 Name: Nidhi Score -1
-----------------------------------	----------------------------------	--------------------------------------	---------------------------------	---------------------------------	----------------------------------

Then Nidhi would be added into Jaisie's group, being the one who reduces it the least:

ID: 1 Name: Sophia	ID: 5 Name: Misha	ID: 2 Name: Jaisie	ID: 9 Name: Nidhi
-----------------------	----------------------	-----------------------	----------------------

ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin
----------------------	----------------------	--------------------------	---------------------	---------------------

These steps would repeat until we form enough groups.

Window Grouper

The WindowGrouper uses 'windows' to form groups. Initially, it starts with a list of students ordered by ID:

ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
-----------------------	-----------------------	----------------------	----------------------	----------------------

ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
--------------------------	---------------------	---------------------	----------------------

We then get windows for each of the ungrouped students. Suppose we want groups of 2: in this case, our windows would be the following:

Window 1		Window 3		
ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
		Window 2		Window 4

Window 5		Window 7		
ID: 5 Name: Misha	ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
		Window 6		Window 8

We then calculate the score of the first window and the window after it.

Window 1 - Score: 50		Window 3		
ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
		Window 2 - Score: 60		Window 4

Window 5		Window 7		
ID: 5 Name: Misha	ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
		Window 6		Window 8

If that window's score is greater than or equal to the next window's score, a group is made out of that window. In this case, the score of the next window is higher, so we don't make a group. Instead, we compare the score of window 2 to window 3:

Window 1		Window 3 - Score: 55		
ID: 1 Name: Sophia	ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 4 Name: Diane	ID: 5 Name: Misha
Window 2 - Score: 60			Window 4	

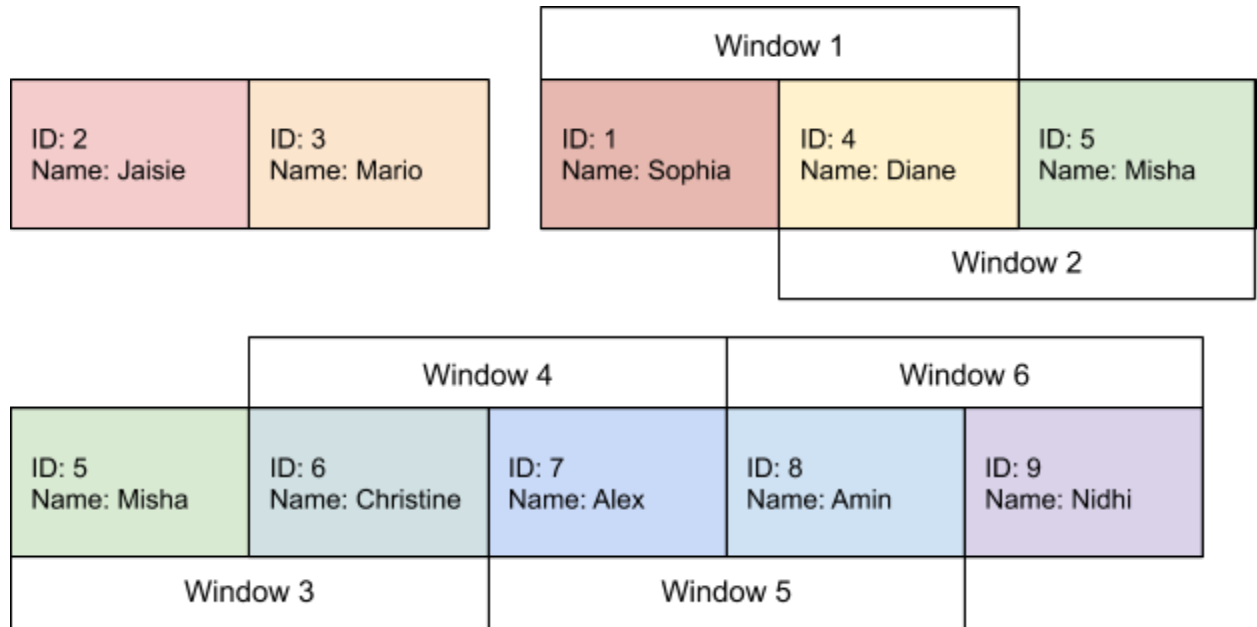

Window 5		Window 7		
ID: 5 Name: Misha	ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
Window 6			Window 8	

In this case, window 2's score is higher than the one after it, so we turn the students in that window into a group, and the remaining 7 students still need to be grouped:

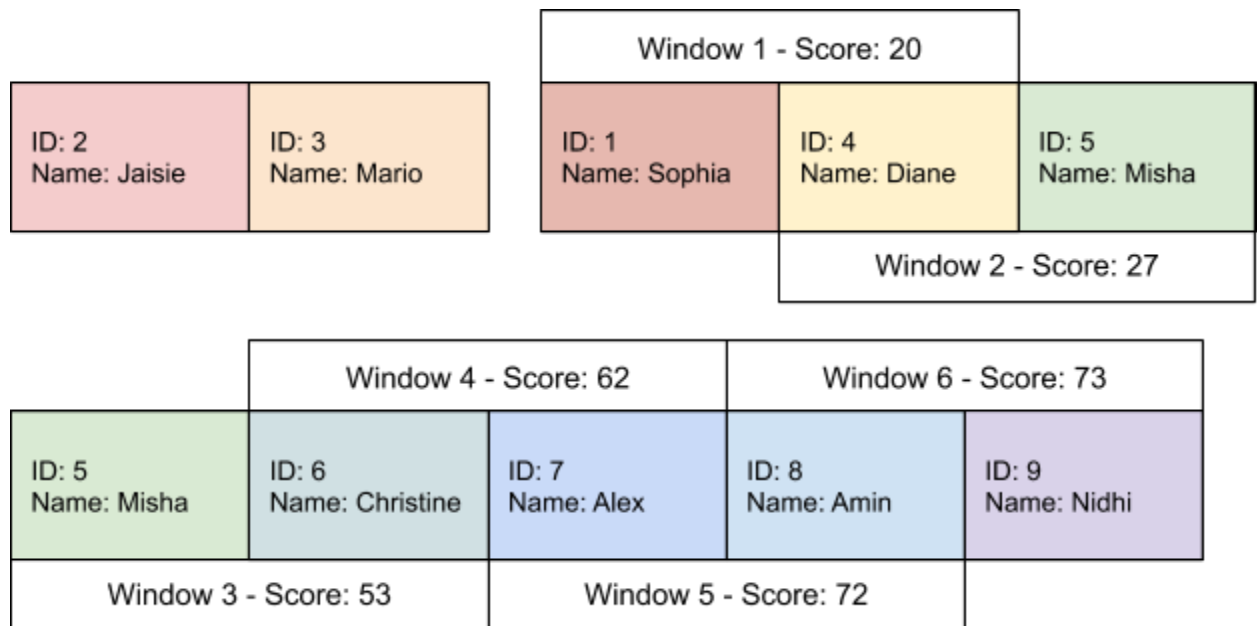

ID: 2 Name: Jaisie	ID: 3 Name: Mario	ID: 1 Name: Sophia	ID: 4 Name: Diane	ID: 5 Name: Misha
-----------------------	----------------------	-----------------------	----------------------	----------------------

ID: 6 Name: Christine	ID: 7 Name: Alex	ID: 8 Name: Amin	ID: 9 Name: Nidhi
--------------------------	---------------------	---------------------	----------------------

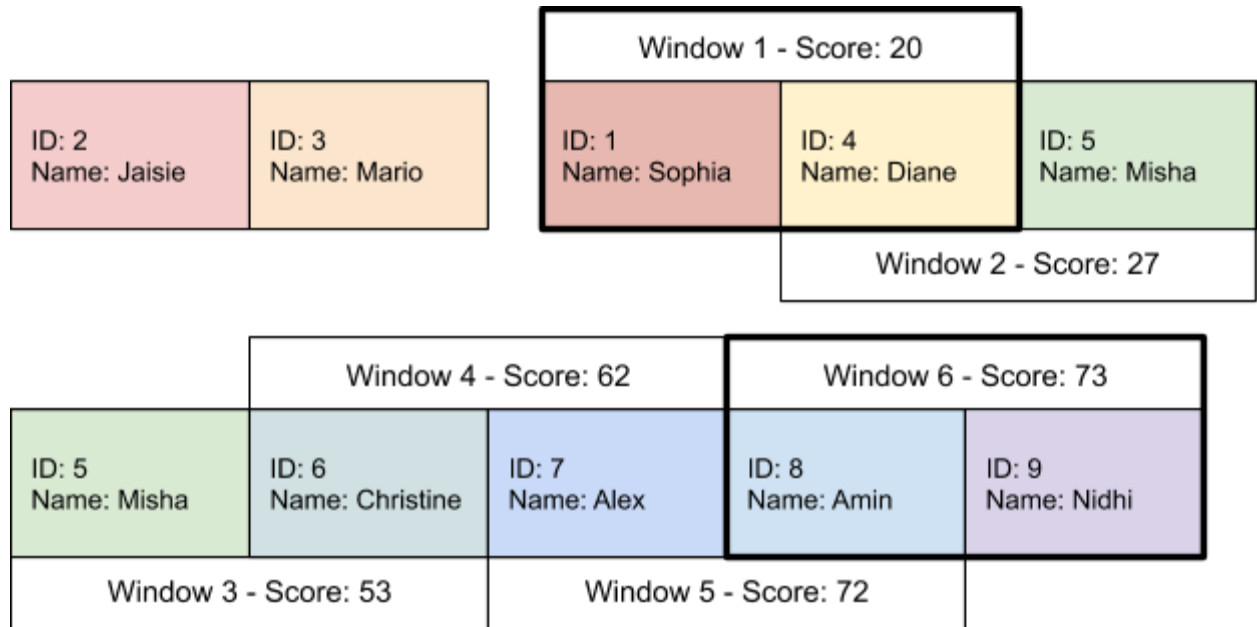

The remaining students are then placed in windows:

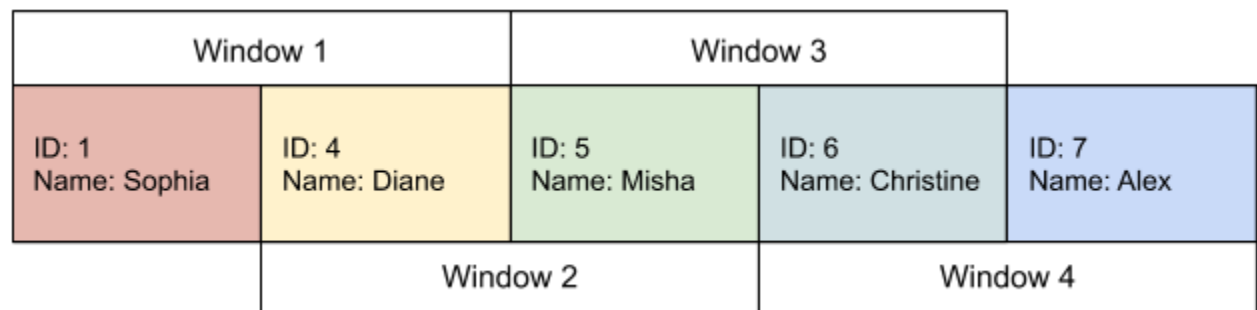

And we repeat the process, finding the first window that has a score greater than or equal to the window after it. Suppose the remaining windows have the following scores:

In this scenario, none of the windows have a score higher than or equal to the window after it, and thus we reach the last window. When we reach the last window, we then compare it to the first window:

Since the last window's score is higher than the first window's, that window is turned into a group, and we start the process again:

At the very end, if there are not enough students to make more than one window, those students are placed into a new group.
